

Black Printed Frame

A masterpiece needs a frame.

Flat glass-ceramic part with **“Ultimate Black”** decoration on the frame which is printed on the inner side to keep the natural glance of the **Keralite® glass-ceramic**.

An opaque and dark black printing with technical and aesthetic advantages.

- The black areas are enough **opaque** to hide both cast iron/steel frame and the seal in order to guarantee a **good finishing** of the assembly.
- Moreover, the intensity of the black color is so dark that you can use it to **modernize** the stove by reducing the presence of cast iron/steel parts and replacing them by a nice shiny black **frame**.

Characteristics

- Max 1500 x 800 mm
- Thickness 4 or 5 mm

- 620°C (1148°F)

- Black frame or strips, with or without gradient dot pattern

KERALITE® GLASS-CERAMIC

Black Printed Frame

A masterpiece needs a frame.

Pattern

- The decoration can have the appearance of a frame, strips, with or without gradient dot pattern.
- We suggest using our standard gradient dot patterns (EK62xx references). Other patterns are available upon request.
- More possibilities of decoration are available thanks to our double-sided printing solution.

Resistance

- The black frame is most often located in a “cold” area where the temperature doesn’t exceed 300°C (572°F). In order to provide all the safety possible, the black decoration has been developed to be high-temperature resistant and withstands 620°C (1148°F).
- Since the glass-ceramic can be handled several times during the assembly, the black frame has the property to resist to abrasion.
- Most of the chemical products dedicated to glass-ceramic cleaning are compatible with the printing. We recommend removing all the chemical residues before the following fire in order to preserve the decoration.
